

Le Hung Thien

Backend Developer

lethien.dev@gmail.com | github.com/thienel | linkedin.com/in/lehungthien

Technical Skills

Languages: Go (Golang), SQL

Backend: Gin, GORM, EntGo, PostgreSQL, Redis, Casbin RBAC, JWT/OAuth2, 2FA/TOTP

Integrations: MS Graph API, Azure AD, Langflow, Apple MDM (NanoMDM)

DevOps: Docker, Docker-Compose, Nginx, Linux Administration

Working Experience

Golang Backend Developer | THD Cybersecurity

Oct 2025 – Apr 2026

Enterprise AI Assistant Platform

Team size: 4

- Designed a **progressive schema with multi-tenant data isolation**, ensuring AI agents and knowledge bases are strictly scoped per department at the repository layer.
- Engineered a **4-layer prompt inheritance pipeline** (Global → Role → Dept → Agent) and dynamic RAG retrieval by injecting vector collection names via Langflow API tweaks.
- Optimized **LLM streaming performance** by decoupling latency from the HTTP lifecycle using buffered Go channels for SSE chunks and implementing async ingestion goroutines.
- Developed a microservice for **SharePoint synchronization** using MS Graph delta tokens and automated webhook renewals for event-driven data propagation.

Technologies: Go, Gin, EntGo, PostgreSQL, Langflow, MS Graph API, Azure AD, Casbin, Docker

Apple MDM Management Portal

Team size: 4

- Architected an **event-driven enrollment flow** using an in-process event bus to decouple side-effects, eliminating circular service dependencies between inventory and deployment workers.
- Implemented an **MDM command lifecycle manager** that tracks command states and correlates Acknowledge webhooks to ensure atomic deployment status updates.
- Automated **infrastructure configuration** by programmatically interacting with the Docker Engine API for zero-downtime reloads of Apple DEP tokens.
- Designed a comprehensive MDM domain model (Devices, Profiles, Assignments) using **EntGo code-gen ORM** with Atlas-managed migrations.

Technologies: Go, Gin, EntGo, PostgreSQL, NanoMDM, NanoDEP, Apple DEP API, Docker

Internal Report & Permission System

Team size: 7

- Refactored backend to **Clean Architecture**, implementing a generic repository pattern and a dynamic query engine to eliminate CRUD boilerplate across all resource endpoints.
- Hardened system security with **Lua-based atomic rate limiting** (Token Bucket), TOTP 2FA, and JWT versioning for instantaneous cross-device session revocation.
- Developed a background task system using **Asynq (Redis)** to handle high-latency operations including OTP delivery, cron-based summary reports, and notification dispatches.
- Orchestrated a **multi-service on-premise stack** via Docker Compose with automated health checks and ordered startup sequences for seamless deployment.
- Implemented a **granular RBAC system** with resource-scoping, ensuring users only access data within their assigned projects and departments.

Technologies: Go, Gin, GORM, PostgreSQL, Redis, Asynq, JWT, TOTP 2FA, Docker, Nginx

Education

FPT University, BS in Software Engineering

Sep 2023 – Apr 2027 (Expected)

- GPA:** 3.2/4.0 — Honorable Student of Semester
- Scholarship:** FPTU1000 — Outstanding achievement nationwide
- IELTS 6.0 Overall** — British Council (2023)
